this book emphasizes the statistical concepts and assumptions necessary to describe and make inferences about real data throughout the book the authors encourage the reader to plot and examine their data find confidence intervals use power analyses to determine sample size and calculate effect sizes the goal is to ensure the reader understands the underlying logic and assumptions of the analysis and what it tells them the limitations of the analysis and the possible consequences of violating assumptions the simpler less abstract discussion of analysis of variance is presented prior to developing the more general model a concern for alternatives to standard analyses allows for the integration of non parametric techniques into relevant design chapters rather than in a single isolated chapter this organization allows for the comparison of the pros and cons of alternative procedures within the research context to which they apply basic concepts such as sampling distributions expected mean squares design efficiency and statistical models are emphasized throughout this approach provides a stronger conceptual foundation in order to help the reader generalize the concepts to new situations they will encounter in their research and to better understand the advice of statistical consultants and the content of articles using statistical methodology the second edition features a greater emphasis on graphics confidence intervals measures of effect size power analysis tests of contrasts elementary probability correlation and regression a free cd that contains several real

designing research is about making decisions to transform an idea into a plan that can provide answers to a research problem or question thinking about and then making these decisions results in the research design the plan that will be followed to conduct the research and answer the question this text engages in a dialogue with the reader providing a serious but accessible introduction to research design for use as a guide when designing your own research or when reading the research of others julianne cheek and elise Øby show that designing research is an iterative and reflexive process in which there is constant thinking through and re visiting of decisions about that design as it develops they use a variety of pedagogical devices throughout the book including tip activity and putting it into practice boxes to emphasize specific points and encourage readers to think about the practical implications of what they have learned

the graphical user interface gui as the most prevailing type of user interface ui in today s interactive applications restricts the interaction with a computer to the visual modality and is therefore not suited for some users e g with limited literacy or typing skills in some circumstances e g while moving around with their hands or eyes busy or when the environment is constrained e g the keyboard and the mouse are not available in order to go beyond the gui constraints the multimodal mm uis appear as paradigm that provide users with great expressive power naturalness and flexibility in this thesis we argue that developing mm uis combining graphical and vocal modalities is an activity that could benefit from the application of a methodology which is composed of a set of models a method manipulating these models and the tools implementing the method therefore we define a design space

based method that is supported by model to model colored transformations in order to obtain mm uis of information systems the design space is composed of explicitly defined design options that clarify the development process in a structured way in order to require less design effort the feasibility of the methodology is demonstrated through three case studies with different levels of complexity and coverage in addition an empirical study is conducted with end users in order to measure the relative usability level provided by different design decisions
